**ABSTRACT**

Methods and computer-readable media are provided for presenting program guide information using a mosaic of video sources broadcast in a television services system. An application program executed on a television services set-top box generates a matrix of still images representing multiple video sources presently being broadcast in the television services system. The matrix of still images is presented as a video mosaic representing current program guide information in the television services system.

## PRESENTING A TELEVISION SERVICES PROGRAM GUIDE INFORMATION AS A VIDEO MOSAIC

### CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a continuation of U.S. patent application Ser. No. 11/704,696, filed Feb. 9, 2007, entitled "Presenting A Television Services Program Guide Information As A Video Mosaic," issued as U.S. Pat. No. 8,132,208, which claims the benefit under provisions of 35 U.S.C. §119(e) of U.S. Provisional Application No. 60/772,151, filed Feb. 10, 2006, entitled "Methods and Computer-Readable Media For Presenting Program Guide Information As A Video Mosaic In A Television Services System."

### BACKGROUND OF THE INVENTION

With the advent of modern television services networks, such as cable and satellite systems, subscribers have grown accustomed to receiving a variety of television programming from numerous broadcasting sources. In recent years, technology advances have enabled subscribers to receive an even greater variety of products and services through television services networks. For example, modern cable services networks provide traditional video television programming, telephone services, high speed Internet access, electronic mail services, video-on-demand, information services, and the like. Through the use of set-top boxes (computing systems), cable and satellite television services providers can provide interactive television services to subscribers. Such interactive television services allow customers to interact directly with service providers in response to services and product offerings presented to the subscribers through their television sets.

Recently, many television services providers are beginning to offer dedicated "mosaic" channels in which live feeds of multiple programming are broadcast on a single video channel on the provider's networks. Currently, mosaic channels display a scaled down "windows" of currently broadcasting programs selected by the provider in one or more categories (i.e., news, sports, etc.) also selected by the provider, along with non-program based audio from a live host or background music.

Current mosaics, however, suffer from a number of drawbacks. One drawback is that the content of each mosaic is determined by the service provider. Thus, subscribers have no control over the programs which make up a particular mosaic channel. Moreover, the content selected by the service provider may not be of interest to some subscribers. Another drawback of current mosaics is that each one takes up an entire video channel in a service provider's channel lineup, leaving fewer channels for providing regular full screen programming. It is with respect to these and other considerations that the present invention has been made.

### BRIEF SUMMARY OF THE INVENTION

In accordance with the present invention, the above and other problems are solved by methods and computer-readable media for presenting program guide information using a mosaic of video sources broadcast in a television services system. According to one aspect of the invention, a method includes generating a matrix of still images representing multiple video sources (e.g., channels) presently being broadcast

2

in the television services system and presenting the matrix of still images as current program guide information in the television services system.

According to other aspects of the invention, the method may be implemented by a set-top box in the television services system having one or multiple tuners. In a set-top box having one tuner, the matrix of still images may be generated from a currently tuned channel during an idle state for the tuner, such as when the tuner is off or when the tuner is generating a graphics screen (e.g., an electronic program guide). In a set-top box having multiple tuners, the matrix of still images may be generated regardless of the currently tuned channel by downloading video windows representing the still images over an extended data channel in the television services system. The matrix may also be generated according to a user-defined filter in which the images meet one or more user-defined criteria.

Other aspects of the invention may be implemented as an article of manufacture such as a computer program product or computer readable media. The computer program product may be a computer storage media readable by a computer system and encoding a computer program of instructions for executing a computer process. The computer program product may also be a propagated signal on a carrier readable by a computing system and encoding a computer program of instructions for executing a computer process.

These and various other features, as well as advantages, which characterize the present invention, will be apparent from a reading of the following detailed description and a review of the associated drawings.

### BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWINGS

FIG. 1 is a network diagram illustrating a cable services network architecture that serves as an illustrative operating environment for the present invention;

FIG. 2 is a simplified block diagram illustrating a customer profile data structure for providing customer profile data to a set-top box according to an embodiment of the present invention;

FIG. 3 is a flow diagram showing an illustrative routine for presenting program guide information using a video mosaic of broadcast video sources in the cable services network architecture of FIG. 1, according to an embodiment of the present invention; and

FIG. 4 is a simplified block diagram illustrating a television screen display of a video mosaic for presenting program guide information according to an embodiment of the present invention.

### DETAILED DESCRIPTION OF THE INVENTION

Embodiments of the present invention may be implemented in a number of distributed computing environments where functionality is tailored for provision to a given user based on a user profile obtained by polling data sources having data associated with the user. According to an actual embodiment, the present invention is implemented in a cable television/services system. FIG. 1 is a simplified block diagram illustrating a cable television/services system (hereafter referred to as "CATV") architecture that serves as an exemplary operating environment for the present invention.

Referring now to FIG. 1, digital and analog video programming, information content and interactive television services are provided via a hybrid fiber coax (HFC) network 115 to a television set 120 for consumption by a cable television/

3

services system customer. As is known to those skilled in the art, HFC networks **115** combine both optical fiber and coaxial cable lines. Typically, optical fiber runs from the cable head end **110** to neighborhoods of 500 to 2,000 customers. Coaxial cable runs from the optical fiber feeders to each customer. According to embodiments of the present invention, the functionality of the HFC network **115** allows for efficient bidirectional data flow between the client-side set-top box **105** and the server-side application server **140** of the present invention.

According to embodiments of the present invention, the CATV system **100** is in the form of a distributed client-server computing system for providing video and data flow across the HFC network **115** between server-side services providers (e.g., cable television/services providers) via a server-side head end **110** and a client-side customer via a client-side set-top box (set-top box) functionally connected to a customer receiving device, such as the television set **120**. As is understood by those skilled in the art, modern CATV systems may provide a variety of services across the HFC network **115** including traditional digital and analog video programming, telephone services, high speed Internet access, video-on-demand, and information services.

On the client side of the CATV system **100**, digital and analog video programming and digital and analog data are provided to the customer television set **120** via the set-top box **105**. Interactive television services that allow a customer to input data to the CATV system **100** likewise are provided by the set-top box **105**. As illustrated in FIG. 1, the set-top box **105** is a multipurpose computing device having a computer processor, memory and an input/output mechanism. The input/output mechanism receives input from server-side processes via the HFC network **115** and from customers via input devices such as the remote control device **128** and the keyboard **130**. The remote control device **128** and the keyboard **130** may communicate with the set-top box **105** via a suitable communication transport such as the infrared connection **132**. The set-top box **105** also includes a video processor for processing and providing digital and analog video signaling to the television set **120** via a cable communication transport **134**. One or more multi-channel tuners are provided for processing video and data to and from the set-top box **105** and the server-side head end system **110**, described below. The set-top box **105** may optionally include an embedded cable modem for communicating data with the head end **110** through the HFC network **115**. In an alternative embodiment of the invention, the set-top box **105** may also be a "tunerless" set-top box, such as an Internet Protocol Television ("IPTV") set-top box, connected to a cable or digital subscriber line ("DSL") modem via an Ethernet connection, which is in communication with the head end **100** via the HFC network **115**.

It will be appreciated by those skilled in the art that the head end **110** may also provide the cable modem with access to the Internet **144** through a cable modem termination system (not shown). Those skilled in the art will understand that according to one embodiment, the embedded cable modem may be implemented in accordance with the Data Over Cable Service Interface Specification ("DOCSIS") developed by Cable Television Laboratories, Inc. (CABLELABS) of Louisville, Colo.

The set-top box **105** passes digital and analog video and data signaling to the television **120** via a one-way communication transport **134**. The set-top box **105** may receive video and data from the server side of the CATV system **100** via the HFC network **115** through a video/data downlink and data via a data downlink. The set-top box **105** may transmit data from

4

the client side of the CATV system **100** to the server side of the CATV system **100** via the HFC network **115** via one data uplink. The video/data downlink is an "in band" downlink that allows for digital and analog video and data signaling from the server side of the CATV system **100** through the HFC network **115** to the set-top box **105** for use by the set-top box **105** and for distribution to the television set **120**. As is understood by those skilled in the art, "in band" refers to data streams that are in the same frequency channel as the program being tuned. "In band" data may be acquired while tuned to the same frequency as the program video. For example, ancillary data in vertical blanking interval ("VBI") or Moving Picture Experts Group ("MPEG") transport data tables are well-known forms of "in band" data.

The data downlink and the data uplink, illustrated in FIG. 1, between the HFC network **115** and the set-top box **105** comprise "out of band" data links. As is understood by those skilled in the art, "out of band" refers to data streams that are present regardless of a video tuner frequency. "Out of band" data utilizes downstream Quadrature Phase-Shift Keying ("QPSK") carriers in the 75 to 77 MHz frequency range and upstream carriers in the 5 to 42 MHz frequency range. According to embodiments of the present invention, data flow between the client-side set-top box **105** and the server-side application server **140** is typically passed through the "out of band" data links. Alternatively, an "in band" data carousel may be positioned in an "in band" channel into which a data feed may be processed from the server-side application server **140** through the HFC network **115** to the client-side set-top box **105**. Operation of data transport between components of the CATV system **100**, described with reference to FIG. 1, is well known to those skilled in the art.

According to various embodiments of the invention, the cable modem may utilize the "out of band" data downlink as an extended or logical data channel. The extended data channel may be divided into smaller channels for providing conditional access to a wide area network (i.e., the Internet) and downloading application data including electronic program guide ("EPG") data and video data as decimated images or video stills from the application server **140** in the head end **110** for creating a video mosaic. As will be discussed in greater detail below with respect to FIGS. 2-4, the decimated images may represent snapshots of video programs being currently broadcast in the CATV system **100**.

The set-top box **105** also includes an operating system **122** for directing the functions of the set-top box **105** in conjunction with a variety of client applications **125** which, as will be described in greater detail below, may include a mosaic application program for taking snapshots to create still images of incoming video data representing multiple channels currently being broadcast in the CATV system **100**, decimating the still images into smaller ages or video windows, and composing the video windows into an  $n \times m$  matrix of images to create a video mosaic, according to one embodiment of the invention. Because a variety of different operating systems **122** may be utilized by a variety of different brands and types of set-top boxes, a middleware layer **124** is provided to allow a given software application to be executed by a variety of different operating systems.

Those skilled in the art will understand that in one embodiment of the invention, the middleware layer **124** may be implemented according to the OpenCable Access Platform ("OCAP") specification developed by Cable Television Laboratories, Inc. (CABLELABS) of Louisville, Colo. In accordance with the OCAP specification, the middleware layer **124** creates a common platform upon which interactive services may be deployed independent of set-top box hard-

5

ware or operating system software choices implemented by a particular service provider. As described below, a corresponding middleware layer **142** is included on the server side of the CATV system **100** for facilitating communication between the server-side application server **140** and the client-side set-top box **105**.

Referring still to FIG. 1, the head end **110** of the CATV system **100** is positioned on the server side of the CATV system and includes hardware and software systems responsible for originating and managing content for distributing through the HFC network **115** to one or more client-side set-top boxes **105** for presentation to customers via televisions **120**. As described above, a number of services may be provided by the CATV system **100**, including digital and analog video programming, interactive television services, Internet access, telephone services, video-on-demand (“VOD”) services, targeted advertising, and provision of information content. As discussed in greater detail below, according to the various embodiments of the present invention, the CATV system **100** may also provide a “video mosaic” service in which a matrix of video stills of programming currently being broadcast on multiple channels is displayed to a user as program guide information.

The application server **140** is a general-purpose computing system operative to assemble and manage data sent to and received from the client-side set-top box **105** via the HFC network **115**. As described above with reference to the set-top box **105**, the application server **140** includes a middleware layer **142** for processing and preparing data from the head end of the CATV system **100** for receipt and use by the client-side set-top box **105**. For example, the application server **140** via the middleware layer **142** may obtain data from third-party services **146** via the Internet **140** for transmitting to a customer through the HFC network **115** and the set-top box **105**. According to one embodiment of the invention, the application server **140** may be configured to extract video data from the head end **110** and generate a customized video mosaic of still images representing various television programs broadcast in the CATV system **100** for transmission to the set-top box **105** over an extended data channel.

According to embodiments of the invention, the application server **140** may also be utilized to obtain customer profile data from services provider data services **160** for preparing a customer profile that may be utilized by the set-top box **105** for tailoring certain content provided to the customer. As illustrated in FIG. 1, the services provider data services **160** include a number of services operated by the services provider of the CATV system **100** which may include data on a given customer. For example, a billing system **162** may include information such as a customer’s name, street address, business identification number, Social Security number, credit history, and information regarding services and products subscribed to by the customer. An electronic mail system **164** may contain information such as electronic mail addresses, high-speed Internet access subscription information and electronic mail (“e-mail”) usage data. An authentication system **166** may include information such as secure user names and passwords utilized by customers for access to network services.

The subscriber information database **168** may include general information about customers such as place of employment, business address, business telephone number and demographic information such as age, gender, educational level, and the like as well as information about subscribed services such as whether or not a customer has high-speed Internet access, an e-mail account, and premium programming access. In addition to the aforementioned services and

6

in accordance with the various embodiments of the present invention, the subscriber information database **168** may also include information as to whether or not a customer subscribes to the video mosaic service briefly described above and which will be described in greater detail below. As should be understood by those skilled in the art, the disparate data services systems **162**, **164**, **166**, **168** are illustrated as a collection of data services for purposes of example only. The example data services systems comprising the data services **160** may operate as separate data services systems, which communicate with a web services system (described below) along a number of different communication paths and according to a number of different communication protocols.

Referring still to FIG. 1, a web services system **150** is illustrated between the application server **140** and the data services **160**. According to embodiments of the present invention, the web services system **150** serves as a collection point for data requested from each of the disparate data services systems comprising the data services **160**. When the application server **140** requires customer profile data from one or more of the data services **160** for preparation or update of a customer profile, the application server **140** passes a data query to the web services system **150**. The web services system formulates a data query to each of the available data services systems for obtaining any available data for a given customer as identified by a set-top box identification associated with the customer. The web services system **150** serves as an abstraction layer between the various data services systems and the application server **140**. That is, the application server **140** is not required to communicate with the disparate data services systems, nor is the application server **140** required to understand the data structures or data types utilized by the disparate data services systems. The web services system **150** is operative to communicate with each of the disparate data services systems for obtaining necessary customer profile data. The customer profile data obtained by the web services system is assembled and is returned to the application server **140** for ultimate processing via the middleware layer **142**, as described above.

Having described an exemplary operating environment for embodiments of the present invention with reference to FIG. 1, preparation and utilization of a customer profile will now be described. FIG. 2 is a simplified block diagram illustrating a customer profile data structure for providing customer profile data to a set-top box according to embodiments of the present invention. As described above, once the web services system **150** assembles required customer data, the customer data is passed back to the application server **140** where a customer profile **200** is prepared for transmission to the client-side set-top box **105** via the HFC network **115**. The customer profile **200**, illustrated in FIG. 2, is for purposes of example only. As should be appreciated by those skilled in the art, the customer profile may contain a variety of different types of information about a given customer that may be useful for targeted advertising and targeted content provision for the customer via the set-top box **105**.

Referring to the customer profile **200**, information gathered by the web services system **150** from one or more of the data services systems **160** is assembled into a data structure for provisioning the set-top box **105**. As illustrated in FIG. 2, a name **205**, address **210**, telephone number **215**, email address **220**, age **225** and gender **230** for a given customer have been obtained and have been populated into the customer profile **200**. As described above, such information may be gathered from any number of data services systems such as the billing system **162**, the email system **164**, the authentication system **166**, or the customer information database **168**.

Additionally, following from the example customer profile **200**, illustrated in FIG. 2, subscription information **240** for the associated customer has been obtained and has been populated into the customer profile. For example, information regarding services or products subscribed to by the customer is provided such as high-speed Internet subscription **250**, email subscription **255**, premium programming subscription **260**, telephone customer services **265**, or video mosaic service **265**. With respect to the video mosaic service **265**, the subscription information **240** may also include customer preferences regarding which channels will be represented in the mosaic. For example, mosaic filters **275** may be used to specify “filters” for determining channels for the mosaic such as, for example, customer specified Favorites (i.e., favorite channels), Recent (i.e., recently viewed) channels, VOD channels, and high definition television (“HDTV”) channels. The mosaic filter **275** may also specify “sub-filters” for main filter channel selections, such as sports and movies genres. Once the customer profile **200** is prepared by the application server **140**, the customer profile may be formatted according to a formatting language such as the Extensible Markup Language and may be transmitted to the set-top box **105**, as described herein.

Referring now to FIG. 3, an illustrative routine **300** will be described illustrating a process performed by the client applications **125** running on the set-top box **105** for presenting program guide information using a video mosaic of broadcast video sources in the CATV system **100**. For purposes of description of the routine illustrated in FIG. 3, consider, for example, that the subscriber profile **200** including a subscriber's video mosaic preferences, is retrieved by the set-top box **105** from the application server **140** upon initialization (or booting) of the set-top box **105** and stored in memory. As understood by those skilled in the art, the set-top box **105** is initialized or booted when first installed, or after an unintentional or intentional loss of power, or when initialization is otherwise required. Alternatively, the routine **300** is also applicable when a previous subscriber profile **200** requires a refresh because of the elapse of a specified amount of time since the last refresh or update of the profile **200**. According to this alternative embodiment, after a given amount of time, for example 24 hours, a refresh of a previously prepared subscriber profile **200** is required to account for subscriber data that may have been updated during the elapsed period.

The routine **300** begins at operation **305**, wherein the client applications **125** select a video source (e.g., a television program) presently being broadcast on a channel in the CATV system **100**. In particular, the client applications **125** instruct a tuner in the set-top box **105** to tune to a channel in the CATV system **100**. In particular, in accordance with one embodiment of the invention, the set-top box **105** is a single tuner set-top box and the video source is currently being received by the tuner. In accordance with this embodiment, the video source may be selected during an idle state for the set-top box tuner, such as when the tuner is in an off state or when the tuner is displaying a graphics screen (such as an electronic program guide) so as not to interfere with normal television viewing. According to an alternative embodiment of the invention, the set-top box **105** is a multiple tuner set-top box and the video source is selected from a secondary tuner which is not currently in use (i.e., is not being used to display video content on the television **120**). In this embodiment, an idle state for the tuner is not required since the secondary tuner may be used to select the video sources. According to yet another alternative embodiment of the invention, the set-top box **105** is a tunerless set-top box connected to a cable or digital subscriber line (“DSL”) modem via an Ethernet con-

nection. In this embodiment, the video source may be selected directly from the server-side head end **110**, via the Internet.

The routine **300** then continues from operation **305** at operation **310** where the client applications **125** decrypt and decode the selected video source (if necessary). In particular, the client applications **125** are operative to instruct the set-top box **105** to determine if a selected video source broadcast from the head end **110** is encrypted (e.g., a pay-per-view channel) and decrypt the selected video source to access the content of the video source. Similarly, the client applications **125** are operative to instruct the set-top box **105** to determine if a selected video source broadcast from the head end **110** is encoded according to a compression algorithm (e.g., the Moving Picture Experts Group compression schemes) and decode the selected video source to access the selected video source as a raw data format. Decryption and decoding schemes for broadcast video sources in a cable television services system are known to those skilled in the art.

The routine **300** then continues from operation **310** at operation **315** where the client applications **125** capture a still image from the selected video source. In particular, a video capture is performed on the selected video source signal to extract an image or video still frame and stored in the set-top box **105**. Video capture techniques of video signals are known to those skilled in the art. It will be appreciated that in one embodiment, the client applications **125** may further compress the video still according to the Joint Photographic Experts Group (“JPEG”) image compression technique. Other image compression techniques may also be utilized. It should be understood that in one embodiment, the still image for a currently tuned channel may be captured from a scaled video window displaying the tuned channel as a picture-in-picture (“PIP”) window when a single tuner set-top box **105** is displaying a graphics screen, such as an EPG guide.

The routine **300** then continues from operation **315** at operation **320** where the client applications **125** scale (i.e., decimate) the video still representing the captured video source into a video window. In particular, the size of the video still may be reduced (using known techniques) to a predetermined size such that a matrix of multiple stills may be displayed on a single graphical display to represent the video mosaic.

The routine **300** then continues from operation **320** at operation **325** where the client applications **125** generate a matrix for the video window. In particular, the client applications **125** may be operative to transfer the video window to the graphics plane for presentation as program guide information for the corresponding video source.

The routine **300** then continues from operation **325** at operation **330** where the client applications **125** determine if there are more video sources from which to generate video windows or stills representing the video mosaic. As discussed above, the number of video stills to be included in the mosaic may be based on the predefined filters and/or sub-filters specified by a customer in the subscriber profile **200** of FIG. 2. In particular, the number of video sources comprising a mosaic may include a subset of channels in the CATV system **100** represented in an EPG. If, at operation **330**, it is determined that additional video windows need to be generated from other video sources, then the routine **300** repeats operations **305-325** where the matrix is further generated by adding video windows representing additional video sources selected by the client applications **125**. If, at operation **330**, it is determined that no additional video sources need to be generated, then the routine **300** continues at operation **335**.

In accordance with one embodiment of the invention, the additional video sources may be converted into video windows in the application server **140** at the head end **110**, and downloaded to the set-top box **105** (using the embedded cable modem) over the extended data channel discussed above with respect to FIG. **1**. It will be appreciated that the conversion of the video windows in the application server **140** may include one or more of the operations **310-320** discussed above. In accordance with another embodiment of the invention, additional video windows may be generated as new video sources are tuned during an idle state of a single tuner set-top box as discussed above in operation **305**. In accordance with yet another embodiment of the invention, additional video windows may be generated continuously using the secondary tuner in a multiple tuner set-top box as discussed above in operation **305**, enabling the matrix to be updated in real-time regardless of the currently tuned video source.

It will be appreciated that, according to one embodiment of the invention, the number of video windows in the matrix may be limited according to the mosaic filter information **270** in the subscriber profile **200**. For instance, the client applications **125** may select video sources or channels according to the Favorites filter, the Recent (i.e., recently viewed channels) filter, the VOD filter, or the HDTV filter. It should be understood that the filter applied to the channels tuned by the set-top box **105** may be further limited by one or more sub-filters. For instance, the channels in the Favorites filter may be further limited by a genre such as by the Sports filter or the Movies filter.

At operation **335**, the client applications **125** instruct the set-top box **105** to display the generated matrix as a video mosaic including current program guide data. The routine **300** then ends. An illustrative television screen display of a video mosaic in accordance with an embodiment of the invention will be described below with respect to FIG. **4**.

FIG. **4** is a simplified block diagram illustrating a television screen display of a video mosaic for presenting program guide information in accordance with one embodiment of the invention. It should be understood that in one embodiment of the invention, the display **400** is tuned for presentation in a HDTV format. It should be understood that the layout and content of the television screen display illustrated in FIG. **4** is for purposes of example only and is not limiting of the variety of different layouts and types of content that may be included in such displays according to illustrative embodiments of the present invention.

Referring now to FIG. **4**, the television screen display **400** includes filter and sub-filter buttons **405-430** for determining the content in the video stills **435** comprising the video mosaic. In particular, the Favorites filter **405** may represent a subscriber's favorite channels, the Recent filter **410** may represent recently viewed channels by the subscriber, the VOD filter **415** may represent VOD channels, and the HDTV filter may represent HDTV channels. The Sports sub-filter **425** and the Movies sub-filters **430** may be associated with any of the aforementioned main filters **405-420** and serve to limit the content of the main filters to these respective genres. It will be appreciated that the content of the display **400** may be changed or updated by selecting one of the filter buttons **405-430**. The mosaic display **400** also includes a Detailed Program Description banner **440** for providing a description of a currently tuned program corresponding to one of the video stills **435**.

Based on the foregoing, it should be appreciated that the various embodiments of the invention include methods and computer-readable media for presenting program guide information using a mosaic of video sources broadcast in a

television services system. An application program executed on a television services set-top box generates a matrix of still images representing multiple video sources presently being broadcast in the television services system. The matrix of still images is presented as a video mosaic representing current program guide information in the television services system. The above specification, examples and data provide a complete description of the manufacture and use of the composition of the invention. Since many embodiments of the invention can be made without departing from the spirit and scope of the invention, the invention resides in the claims hereinafter appended.

I claim:

**1.** A method of presenting program guide information using a mosaic of video sources broadcast in a television services system, comprising:

generating a customer profile from gathered customer data and from filter parameters specified by a user;

presenting a program guide page having a mosaic, at least one main mosaic filter button and at least one mosaic sub-filter button displayed in the program guide page, the filter parameters specified by the user in the customer profile specifying which of the at least one main mosaic filter button and the at least one mosaic sub-filter button are displayed, the at least one main mosaic filter button configured when selected from the program guide page to generate a first matrix of still images by filtering a plurality of video sources presently being broadcast in the television services system according to the generated customer profile, selecting a first video source from the plurality of video sources as a current video source according to the retrieved customer profile, and selecting a next video source from the plurality of video sources as the current video source according to the retrieved customer profile, without requiring diversion of a tuner currently displaying video content on a display for each selection from the plurality of video sources to occur, and capturing a still image upon each subsequent selection from the plurality of video sources to form the first matrix of still images, the at least one mosaic sub-filter button configured when selected from the program guide page to limit content associated with the at least one main mosaic filter button;

upon selection of the at least one main mosaic filter button from the program guide page, presenting in the program guide page the first matrix of still images representing the plurality of video sources presently being broadcast in the television services system according to the generated customer profile;

upon selection of the at least one mosaic sub-filter button from the program guide page, filtering the first matrix of still images associated with the at least one main mosaic filter button to present in the program guide page only a second matrix of still images, wherein the second matrix of still images is a sub-set of the first matrix of still images; and

refreshing the program guide page by determining whether the filter parameters of the customer profile have been updated by the customer and modifying which of the at least one main mosaic filter button or the at least one mosaic sub-filter button are displayed by the program guide page accordingly.

**2.** The method of claim **1**, wherein selecting a first video source from the plurality of video sources as a current video source according to the retrieved customer profile comprises: determining an idle state for the tuner in communication with the plurality of video sources; and

## 11

selecting a video source currently tuned by the tuner as the current video source during the idle state.

3. The method of claim 2, wherein determining an idle state for tuner in communication with the plurality of video sources comprises determining when the tuner is in an off state.

4. The method of claim 2, wherein determining an idle state for the tuner in communication with the plurality of video sources comprises determining when the tuner is displaying a graphics screen.

5. The method of claim 2, wherein selecting a next video source from the plurality of video sources as the current video source according to the retrieved customer profile comprises:

determining whether a new video source according to the retrieved customer profile is currently tuned by the tuner; and

selecting the new video source as the next video source.

6. The method of claim 1 further comprising:

decrypting each of the plurality of retrieved video sources; and

decoding each of the plurality of retrieved video sources.

7. The method of claim 1, wherein selecting a first video source from the plurality of video sources as a current video source according to the retrieved customer profile comprises selecting the first video source from a second tuner in a multiple tuner set-top box.

8. The method of claim 1 further comprising displaying a program description banner in the program guide page for providing a description of a currently tuned program corresponding to one of the still images displayed in the program guide page.

9. A computer-readable medium, the computer-readable medium not including a propagated signal and tangibly embodying computer-executable instructions which, when executed on a computer, cause the computer to perform a method of presenting program guide information using a mosaic of video sources broadcast in a television services system, the method comprising:

generating a customer profile from gathered customer data and from filter parameters specified by a user;

presenting a program guide page having a mosaic, at least one main mosaic filter button and at least one mosaic sub-filter button displayed in the program guide page, the filter parameters specified by the user in the customer profile specifying which of the at least one main mosaic filter button and the at least one mosaic sub-filter button are displayed, the at least one main mosaic filter button configured when selected from the program guide page to generate a first matrix of still images by filtering a plurality of video sources presently being broadcast in the television services system according to the generated customer profile, selecting a first video source from the plurality of video sources as a current video source according to the retrieved customer profile, and selecting a next video source from the plurality of video sources as the current video source according to the retrieved customer profile, without requiring diversion of a tuner currently displaying video content on a display for each selection from the plurality of video sources to occur, and capturing a still image upon each subsequent selection from the plurality of video sources to form the first matrix of still images, the at least one mosaic sub-filter button configured when selected from the program

## 12

guide page to limit content associated with the at least one main mosaic filter button;

upon selection of the at least one main mosaic filter button from the program guide page, presenting in the program guide page the first matrix of still images representing the plurality of video sources presently being broadcast in the television services system according to the generated customer profile;

upon selection of the at least one mosaic sub-filter button from the program guide page, filtering the first matrix of still images associated with the at least one main mosaic filter button to present in the program guide page only a second matrix of still images, wherein the second matrix of still images is a sub-set of the first matrix of still images; and

refreshing the program guide page by determining whether the filter parameters of the customer profile have been updated by the customer and modifying refreshing the program guide page by determining whether the filter parameters of the customer profile have been updated by the customer and modifying which of the at least one main mosaic filter button or the at least one mosaic sub-filter button are displayed by the program guide page accordingly.

10. The computer-readable medium of claim 9, wherein selecting a first video source from the plurality of video sources as a current video source according to the retrieved customer profile comprises:

determining an idle state for the tuner in communication with the plurality of video sources; and

selecting a video source currently tuned by the tuner as the current video source during the idle state.

11. The computer-readable medium of claim 10, wherein determining an idle state for the tuner in communication with the plurality of video sources comprises determining when the tuner is in an off state.

12. The computer-readable medium of claim 10, wherein determining an idle state for the tuner in communication with the plurality of video sources comprises determining when the tuner is displaying a graphics screen.

13. The computer-readable medium of claim 10, wherein selecting a next video source from the plurality of video sources as the current video source according to the retrieved customer profile comprises:

determining whether a new video source according to the retrieved customer profile is currently tuned by the tuner; and

selecting the new video source as the next video source.

14. The computer-readable medium of claim 9 further comprising:

decrypting each of the plurality of retrieved video sources; and

decoding each of the plurality of retrieved video sources.

15. The computer-readable medium of claim 9, wherein selecting a first video source from the plurality of video sources as a current video source according to the retrieved customer profile comprises selecting the first video source from a second tuner in a multiple tuner set-top box.

16. The computer-readable medium of claim 9 further comprising displaying a program description banner in the program guide page for providing a description of a currently tuned program corresponding to one of the still images displayed in the program guide page.
